

DIAHYDRO[®]

High Performance Soil Amendment

Diahydro[®] Calcined Diatomite, Highly Pure, Highly Porous, Highly Effective.

No other soil amendment offers as much water absorption and porosity as Diahydro[®]. Absorbing up to 145% of its own weight in water Diahydro[®] Calcined Diatomite is a naturally occurring mineral that is up to 85% porous.

Diahydro[®] will maintain its structure and not compact.

Diahydro[®] consists of up to 95% Pure Silica, one of nature's hardest materials. Calcined for extra hardness, porosity will not be compromised as a result of temperature changes, moisture changes or soil pressure.

More aeration and porosity/water absorption potential per kg than any other soil amendment.
